# Electromagnetic flowmeters

## *Features:*

- ✓ The electromagnetic flowmeter is an application of the **principle of induction**.
- ✓ If a conductor of length  $l$  moves with a transverse velocity  $v$  across a magnetic field of intensity  $B$ , the voltage difference generated between its two ends is:  $e = Blv$ .
- ✓ If the ends of the conductor are connected to some **external circuit that is stationary with respect to the magnetic field**, this  $e$  will cause a current  $i$  to flow and the terminal voltage of the moving conductor becomes  $e - iR$ .

# Electromagnetic Flowmeters

## *Practical Situation:*

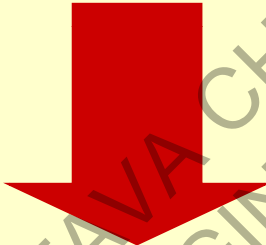

- ✓ **The magnetic field is of limited extent.**
- ✓ **no voltage is induced in that part of the jet which is outside the field.**
- ✓ **These parts of the fluid are still conductive paths, and they tend to partially short circuit the voltages induced in the section exposed to the field.**

# Electromagnetic Flowmeters

## *Practical Constraints:*

- ✓ **The pipe must be nonmagnetic.**
  - ✓ **The pipe is usually nonconductive.**
- 
- ✓ **It is impractical to make the entire pipe non-conductive and a short length (the flowmeter itself) of non-conductive pipe is coupled into an ordinary metal-pipe installation.**

# A Practical Solution for Electromagnetic Flowmeters (contd...)

✓ The signal source  $e = BD_p v$ ;  
 $D_p$  = separation of electrodes  
 = metering tube diameter.

✓ If a conductive fluid is moving with an average velocity  $\bar{v}$ , and if we assume that the fluid fills the tube, then:

$$\bar{v} = \frac{Q}{\pi D_p^2 / 4} \quad \Rightarrow \quad e = \frac{4B}{\pi D_p} Q$$

✓ Calculation of  $R_1$  is complex.

# Magnetic field in Electromagnetic Flowmeters

- ✓ The magnetic field used in such a flowmeter can be either **constant** or **alternating** giving rise to a **dc** or an **ac output signal**, respectively.
- ✓ For many years, ac systems (**50** or **60 Hz**) were most common, since they reduced polarization effects at the electrodes, and had other advantages.
- ✓ However the major disadvantage was that the **powerful ac field coils** induced **spurious ac signals** into the measurement circuit.
- ✓ About **1975**, industrial meters utilizing an **interrupted dc** field became available, and currently the market is shared mainly by these two types.

Flow related signal

$$E_Q = \left[ E_2 - \frac{(E_1 + E_3)}{2} \right] - \left[ E_4 - \frac{(E_3 + E_5)}{2} \right]$$

# Magnetic field in Electromagnetic Flowmeters (contd...)

- ✓ This arrangement implements an **automatic zero correction** feature which corrects for zero errors several times a second .
- ✓ Such an arrangement can provide **significant power savings**. However, **response time** may be a little slow in some applications.
