

**M. Sc. MATHEMATICS EXAMINATION, 2023**

( 2nd Year, 2nd Semester )

**ADVANCED NUMERICAL ANALYSIS ( THEORY)****UNIT – 4.1**

Time : One hour

Full Marks : 20

Symbols &amp; Notations have their usual meanings.

Answer any *Two* questions.

1. Use Ritz method to solve the two-point boundary value problem

$$u'' + x^2 = 0 \text{ for } 0 < x < 1,$$

subject to the boundary conditions  $u(0)=1$ ,  
 $u'(1)+2u(1)=1$  with quadratic trial functions. 10

2. Describe Galerkin method for the boundary value problem:  $Lu = f$  in  $\mathcal{R}$  and hence find a one-parameter approximate analytical solution of the non-linear equation

$$-2u \frac{d^2u}{dx^2} + \left( \frac{du}{dx} \right)^2 = 4 \text{ for } 0 < x < 1,$$

subject to the boundary conditions  $u(0)=1$ ,  $u(1)=0$ .

10

3. Solve the Volterra integral equation

$$f(x) - \int_0^x (1+2x-3u)f(u)du = x + \frac{2}{3}x^3$$

For  $x = 0$  (0.2) 0.4 by approximating the integral using Trapezoidal rule. 10
