OPEN ELECTIVE

BE 3RD AND 4TH YEAR, 2ND SEMESTER EXAMINATION, 2023 OBJECT ORIENTED PROGRAMMING FUNDAMENTALS

Time: 3 hours Full Marks: 100

Answer all parts of a question together in one place. Do not scatter the answers.

snippets (where needed) for justification. (Any 3) i) Default values in function parameters must be supplied from left to right. ii) We can make a function inline by just specifying the keyword <i>inline</i> before the function signature. iii) Call by reference takes lesser space than call by value. iv) Function call statement must always appear on the right hand side of assignment operator. b) Distinguish among each of the following triples. (Any 3) i) Iteration vs. normal recursion vs. tail recursion ii) Array vs. structure vs. class iii) malloc() vs. calloc() vs. new iv) Local variables vs. reference variables vs. pointer variables c) Write a recursive function to calculate a to the power b (a ^b). Both a and b are taken from user. Hence, calculate the sum of the following series:

Tionico, calculate the sum of the following series.		
1+8+81+1024+		
110101110241 It certifis. (Osci will decide the value of it at full time)		
Or,		
Create an array of N number of elements dynamically. Next pass it to a function that finds out the higher		
element from the array recursively. N should be taken from user at runtime.		
[(3x3)+(3x3)+7=2		
CO2 2. a) Fill up the blanks with suitable phrases. Hence justify the validity of each of the completed statement		
with supporting reasons. Provide code snippets where needed.		
[30 MARKS]		
MARKS] i) Data encapsulation means and it can be achieved by		
ii) Two functions cannot be overloaded on the basis of only. Their must diffe		
iii) this operator cannot be used within because		
iv) The compiler always provides one for a class only if we		
v) Only the member variables of a class can be accessed within functions		
vi) Copy constructor always takes as parameter because		
vii) A constant object of a class can be used to invoke only the methods so that		
viii) Constructors can be because However the cannot be		
ix) Only the member variables of a class can be changed within function		
Ly) Heave of friend alasses/functions is because		
x) Usage of friend classes/functions is because		
xi) Function overloading is also known as time polymorphism or binding.		
xi) Function overloading is also known as time polymorphism or binding. xii) A constant member variable of a class can be initialized by		

```
b) Assume a class Money as the following definition. Now complete the class definition in order to properly
             execute the statements in the main() method. Finally discuss the output.
                 class Money
                                                                 int main()
                  int rupees, paise;
                                                                  Money m1(450,90), m2(500,70),m4;
                };
                                                                  Money m3=m1;
                                                                  m3.add(m2);
                                                                  m3.show();
                                                                  m4 = subtract(m2, m1);
                                                                  m4.show();
                                                                  Or,
             Consider the following code snippet. Initialize the variable s with 10 and hence discuss the output of the code
             with proper reasons.
                                                                  int main()
             class Sample
                int a:
                                                                   Sample s1(3), s2;
                                                                   s1.show();
               static int s;
               public:
                                                                   s2.show();
               Sample (int x=0)
                                                                   Sample ob[3];
               { s++;
                                                                  for(int i=0; i<3; i++)
               a=s+(++x);
                                                                  ob[i].show();
                                                                  Sample s3(i+1);
                                                                  s3.show();
              void show()
                  cout<<"a="<<a<<"s=""<<s<endl;
                                                                  Sample s4(i+2);
                                                                  s4.show();
             };
                                                                  j.
                                                                                                           [(2x12)+6=30]
  CO<sub>3</sub>
                 a) Consider the following class Sample. Update its definition to perform the tasks as specified in main().
                 Clearly indicate which portion of the class is dedicated for which task. Finally discuss the output.
   [30
                                                           int main()
MARKS]
               class Sample
                                                           { Sample ob1(3), ob2(4), ob3;
               {
                                                           ob1+=2;
               int s;
                                                           ob3 = ob1*(ob2+5);
               };
                                                           cout << ob3;
                                                           ob2=20 + ob3++;
                                                           cout << ob2 << endl << ob3;
                                                                   Or,
            Distinguish between each of the following pairs: Provide suitable code snippets in support of your answer.
            i) Normal virtual function vs. pure virtual function
            ii) Normal destructors vs. virtual destructors
            iii) Late binding vs. early binding
            iv) Multiple inheritance vs. hybrid inheritance
```

	b) Consider the following two classes A and B. Complete their definitions to execute the statements specified		
	in main(). Clearly indicate which portion of the class is dedicated for which task. Finally discuss the output.		
	The order of the classes should not be changed.		
	class A	int main()	
	{ int a;	V	
	<i>};</i>	{ A obal;	
		B obb1 (5);	
	class B	obal=obbl;	
	{ int b;	obal->show();	
	};	B obb2,obb3;	
	<i>P</i>	obb3=obb2(10);	
		cout< <obb2<<endl<<obb3;< th=""><th></th></obb2<<endl<<obb3;<>	
		obb3-=++obb1;	
	,	cout< <obb1<<endl<<obb3;< th=""><th></th></obb1<<endl<<obb3;<>	
		}	
	c) Fill up the blanks with appropriate phrases. Hence justify the validity of each of the completed sentences.		
	(Use code snippets if/where required for justification)		
	i) A pure virtual function, even if the class makes it ii) The of a class the class. Otherwise, error is reported.		
	ii) Theof a class _	the class. Otherwise,	error is reported.
	iii) For overloading input and output operators, we always have to use functions because		
	iv) For converting a basic data type to an object of a class, we need However,		
	for the reverse we need		
	v) The data members of a class have more strict accessibility than public data members, but		
	less strict accessibility than data members.		
	ti) For I I operator overloaded function	on, it is better to return be	001159
	VI) For [] operator overloaded function	on, it is better to return be	[8+10+(2x6)=30]
	1 2 2		[8+10+(2x0)-30]
CO4	4. a) Do as directed:		
[15	i) If an object a class is evented before	a a try block than on coming out of that	block the destructor of the class
MARKS]	i) If an object a class is created before a try block, then on coming out of that block, the destructor of the class is called first and the catch block is executed next.—(Justify the truth/falsity of the statement with valid reason.)		
WAKKS	ii) There is a provision of rethrowing an exception if (Fill in the blank with		
	If there is a provision of redirowing an exception if (Fin in the brank with		
	appropriate phrases. Use code snippet in support of your answer.)		
	iii) After executing the statements in the catch block, the program control again returns to the try block. (State		
	true or false. Provide reasons and/or code snippets in support of your answer)		
	iv) If we are not sure about the exact type of exception being thrown, then how can we handle such scenario?		
	(Show with suitable code snippet)		
	b) What are the possible modes in which a file can be opened? State the significance of each of them.		
	c) Show how a custom exception class object can be created, thrown and handled. (Use code snippet to show)		
			[(2x4)+3+4=15]

Course Outcomes:

- CO1: Recognize and illustrate the basic concepts of OOP and its enhancements over procedural languages.
- CO2: Explain, illustrate and recognize the basic features of classes and objects.
- CO3: Explain and demonstrate the extended features of OOP (Inheritance, Polymorphism, Operator overloading).
- CO4: Illustrate basic I/O, file I/O and exception handling.
