

**Department of Instrumentation and Electronics Engg
Jadavpur University**

Syllabus of BIEE Course (Effective from 2018-19)

Course code: FET/BS/B/Math/T/ 211	Mathematics-III	L	T	P	C
		2	1	0	3
Course Prerequisites	BS/MTH/T111, BS/MTH/T122				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Statistical methods in applied sciences • Vector algebra and calculus and their practical applications • ODEs and PDEs and their practical applications 				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Solve problems related to probability, conditional probability, measures of central tendency, measures of dispersion, correlation and regression, discrete and continuous random variables, distribution functions, expectation and variance (K3)</p> <p>CO2: Compute scalar and cross product of vectors in 2 and 3 dimensions and apply in problems of mechanics (K3)</p> <p>CO3: Comprehend vector differentiation and ideas of divergence, curl, and gradient, vector fields and Green's theorem, Gauss Theorem, Stokes' theorem and their applications (K2)</p> <p>CO4: Apply vector integration including line, surface and volume integrals (K3)</p> <p>CO5: Solve ordinary and partial differential equations of first order using classical methods (K3)</p> <p>CO6: Solve linear differential equations and their systems of second order using classical method and comprehend applications to one dimensional wave and diffusion equations and two dimensional Laplace equation.(K3)</p>				
Unit I	<p>Probability and Statistics: 8L+4T</p> <p>Definition of probability; Conditional probability and independence; Bayes's theorem; Collection and Representation of Statistical data: Measures of Central Tendency & Dispersion; Correlation and Regression; Expectation and Variance; Random variables; Discrete and Continuous distribution; Poisson, Normal and Binomial distribution; Chebyshev's inequality.</p>				
Unit II	<p>Vector Algebra: 4L+2T</p> <p>Basics of vector algebra; Dot and Cross products of two vectors; Product of three or more vectors; volume of tetrahedron; Work done; Moment; Angular velocity. Applications to mechanics;</p>				
Unit III	<p>Vector Calculus: 6L+3T</p> <p>Vector functions of a scalar variable; Limit; Continuity and Derivative of vector functions; Applications to mechanics; Partial derivatives of vector function of more than one variables; Directional derivative; Gradient; Divergence and Curl; Vector Integration; Line integrals; Surface integrals and volume integrals; Green's theorem in the plane; Gauss Theorem; Stokes' Theorem and their application; Tangent Normal and Binormal of space curve; Serret-Frenet formulae; Normal plane, Rectifying plane and oscillating plane</p>				
Unit IV	<p>Ordinary Differential Equations: 6L+3T</p> <p>First order differential equations - exact, linear and Bernoulli's form, second order differential equations with constant coefficients, method of variation of parameters, general linear differential equations with constant coefficients, Euler's equations, system of differential equations.</p>				
Unit V	<p>Partial Differential Equations: 8L+4T</p> <p>First order PDE; Lagrange method; Second order PDE with constant coefficients and their classification to Elliptic, Parabolic and Hyperbolic type. Solution of PDE by method of separation of variables; Solution of one-dimensional wave and diffusion equation; Laplace equation of two dimensions.</p>				

Course code: IEE/PC/B/T/212	Circuit Theory	L	T	P	C
		3	1	0	4
Course Prerequisites	BS/MTH/T111, BS/MTH/T122, BS/PH/TP104				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • The fundamental laws and elements of electrical circuits. • The energy properties of electrical elements and the techniques to measure voltage and current. • Transient and steady-state responses of circuits. • Application of circuit analysis to DC and AC circuits. • Advanced mathematical methods such as Laplace transforms along with linear algebra and differential equations techniques for solving circuits problems. • Three phase ac circuits 				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Define and explain basic concepts of circuits(K1, A1) CO2: Describe the transient behaviour of circuits(K2,A1) CO3: Describe the sinusoidal behaviour of circuits (K2,A1) CO4: Discuss the applications of circuit theorems in different circuits, including 3-phase circuits (K3-apply,A2)</p>				
Unit I	<p>Introduction : 8hrs CO1 Systems Concepts: Causality, linearity and time-invariance, Principle of superposition, Circuit as a system, Integro-differential equation representation. Passive Elements and Sources: Mathematical representation of ideal resistors, inductors and capacitors, Real or non-ideal passive elements, Ideal independent voltage and current sources, Dependent sources.</p>				
Unit II	<p>Circuit theorems : 10hrs CO1 Ohm's law revisited, ohmic and non-ohmic elements, Kirchoff's current and voltage laws, Series and parallel circuits, Maxwell's mesh current method, Node voltage method, Thevenin's theorem, Norton's theorem, Source transformation and its application, Maximum power transfer theorem, Simple circuits using dependent sources.</p>				
Unit III	<p>Transients in Circuits: 8hrs CO2 Simple R-L and R-C series circuits, Solution of simple R-L, R-C and R-L-C circuits containing dc excitation. Application of Laplace Transforms in circuit theory. Concept of s-domain variables.</p>				
Unit IV	<p>Sinusoidal Steady-state Analysis: 8hrs CO3 Sinusoid and its transformation to a phasor, Current and voltage phasors in single-element circuits, Concept of reactance, impedance, susceptance and admittance as phasors.</p>				
Unit V	<p>Circuit analysis using circuit theorems : 8hrs CO4 Parallel and series-parallel circuits, Apparent, real and reactive power, Power factor, Maxwell's mesh current method and Thevenin's theorem in AC circuits, Series resonance, Bandwidth and Q-factor, Parallel resonance, Mutual inductance and coupled circuits.</p>				
Unit VI	<p>3-Phase Circuits: 6hrs CO4 Generation of a balanced, 3-phase supply and its phasor representation, Phase and line voltages and currents for star- and delta-connected loads, Power and reactive power measurement using two-wattmeter method.</p>				
Text Books	1) Engineering Circuit Analysis by W. H. Hayt& J. E. Kemmerly, McGraw-Hill Book Company Inc.				
Reference Books	1) Fundamental of electric circuits by C. K. Alexander and M. N. O. Sadiku, Tata McGraw-Hill Education, 2 nd edition, 2002.				
Mode of Evaluation	Written CT-I & II and Assignments Final-Written Term End Examination				
Course delivery format	Power point teaching and assignments				
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications				
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples				
Supporting Laboratory course					

Course code: IEE/PC/B/T/213	Fundamentals of Instrumentation	L T P C 3 0 0 3
Course Prerequisites	BS/MTH/T111, BS/MTH/T122, BS/PH/TP104, BS/CH/TP103	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • a general instrument, its components, mode of operation, the input-output configurations and the various types of signal conditioning used for these instruments. • static and dynamic characteristics of various systems and their time and frequency responses to different inputs. • errors in measurement and their statistical analysis. • various types of sensing elements. 	
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe an instrument including their functional elements, input output configurations and signal conditioners used. (K1, A1)</p> <p>CO2: State, explain and illustrate the various performance characteristics of a general instrument. (K1, K2, A1)</p> <p>CO3: Compute the errors in measurement from experimental data and perform their statistical analysis. (K3,A2 - show)</p> <p>CO4: Describe the commonly used electrical, thermal and radiation type sensing elements including their principles of operation, specifications and circuits.(K1, A1)</p>	
Unit I	<p>Introduction : 10hrs :CO1</p> <p>Basic concept of Instrumentation system: functional elements of an instrument, electrical equivalents of mechanical and other systems, input-output configurations. classification of systems according to their mode of operation</p> <p>Signals: Types of signals and their characteristics, Signal conditioning. Signal modulations, deflection bridges, a.c carrier systems</p> <p>Continuous time Fourier series, Continuous time Fourier transform</p>	
Unit II	<p>Performance characteristics: 8hrs : CO2</p> <p>Systems: Types of systems and their behavior.</p> <p>Mathematical modeling of the system: System realizations using Laplace transform. Convolution and Differential equations, Definition & determination of Transfer function of a system.</p> <p>Performance characteristics: static characteristics, loading effects,</p> <p>Dynamic characteristics of a system: frequency response analysis, and response of a general form of instrument.</p>	
Unit III	<p>Errors in Measurement and Statistical analysis: 10hrs :CO3</p> <p>Errors in measurement: definitions, noise in measurement systems using statistical concept</p> <p>Statistical concept: probability distribution function, chi-square test, curve fitting technique, power spectral density and autocorrelation.</p> <p>Static characteristics of a system: relating with statistical analysis.</p>	
Unit IV	<p>Sensing Elements: 28hrs :CO4</p> <p>Basic sensing elements: Resistive elements (potentiometer, strain gage), (resistance thermometers)</p> <p>Capacitive elements (variable separation, area, dielectric),</p> <p>Inductive elements (variable inductance, (inductive) potentiometer, variable reluctance, LVDT),</p> <p>Magnetic type (eddy current, magnetostrictive, magnetoresistive),</p> <p>Hall devices, Piezoelectric element, (Piezo resistive element), Squid.</p> <p>Thermal transducers: RTD, thermistors, (hot wire anemometers)</p> <p>Radiation detectors (bolometers, pyroelectric type), (optical pyrometer) Photo detector,</p>	
Text Books	<p>1) Transducers and Instrumentation, D. V. S. Murthy, Prentice-Hall Inc. (2nded.), 2010.</p> <p>2) Introduction to Measurements and Instrumentation, A. K. Ghosh, Prentice-Hall Inc. (4thed.), 2012.</p>	
Reference Books	<p>1) Measurement Systems: Application and Design, E. O. Doebelin, McGraw Hill (4thed.), 1990.</p> <p>2) Principle of Measurement Systems, J. P. Bentley, Pearson Education (4th ed.), 2005.</p> <p>3) Instrumentation for Engineering Measurements, James W. Dally, William F. Riley, Kenneth G. McConnell, John Wiley & Sons(2nded.), 2006.</p>	

Course code: IEE/PC/B/T/214	Electronic Circuits	L	T	P	C
		3	1	0	4
Course Prerequisites	ES/BE/T102B				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • The construction and working principle of different types of diode circuits • Philosophy and performance of various electronic amplifier circuits • Architecture and behavior of different feedback topologies in amplifier circuits • Structure and characteristics of RC and LC oscillator circuits • Role of power amplifiers in electronic circuits 				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Classify and analyze different types of diode circuits (K2,K4, A1-explain)</p> <p>CO2: Identify and interpret the importance of biasing in electronic amplifiers (K3, A1-recognize)</p> <p>CO3: Describe and explain the behavior of small signal amplifiers (K2, A1)</p> <p>CO4: Differentiate and examine feedback circuits of various kinds (K4, A2)</p> <p>CO5: Explain and analyze the operation of oscillators and power amplifiers (K2-describe, K4, A1)</p>				
Unit I	Introduction: 8 Hrs: CO1				
	Introduction to diode circuits: Rectifier, Clipper, Clamper, Filter- Circuit diagrams with performance indices				
Unit II	Introduction to Electronic Amplifiers: 8 Hrs: CO2				
	Classification of amplifiers, Basic transistor amplifier circuits, Different modes of operation: CE, CB, CC, Different types of biasing techniques and bias stability.				
Unit III	Small Signal Behavior of Amplifiers: 8 Hrs: CO3				
	Small signal models of BJT amplifiers: π -model, hybrid model, Concept of DC and AC load lines, Calculation of voltage and current gains, Principles of multistage amplification, different topologies for multistage amplifier: CE-CE, CE-CB, CE-CC, Circuit diagrams and associated small signal models				
Unit IV	Frequency Response Characteristics of Small Signal Amplifiers: 6Hrs: CO3				
	Role of various capacitors on the overall frequency response of single stage amplifier-coupling capacitor, bypass capacitor, load capacitor, transistor stray capacitor, Miller effect and its implication, frequency response of multistage amplifiers				
Unit V	Feedback Amplifiers: 10 Hrs: CO4				
	Basic concept of feedback, Effect of feedback on several parameters pertaining to amplifier circuits, Different topologies of feedback: Current-series, Voltage-shunt, Voltage-series, Current-shunt, Calculation of closed loop gain for each of the feedback amplifier circuits				
Unit VI	Oscillators:6 Hrs: CO5				
	Fundamental idea behind oscillation, Barkhausen criterion, RC oscillators: Phase shift and Wien bridge oscillator, LC oscillators:Hartley and Colpitt oscillator				
Unit VII	Power Amplifiers:4 Hrs: CO5				
	Basic principles of power amplifiers, Types and classification of power amplifiers: Class A, Class B, class AB push-pull etc., Calculation of power efficiency				
Text Books	<ol style="list-style-type: none"> 1) Donald A Neamen, "Electronic Circuits: Analysis and Design", McGraw Hill. 2) J. Millman and C. C. Halkias, "Electronic Devices and Circuits", McGraw Hill. 3) Thomas L Floyd, "Electronic Devices: Electron Flow Version", Prentice Hall of India. 				
Reference Books	<ol style="list-style-type: none"> 1) A. Mottershead, "Electronic Devices and Circuits: An Introduction", Prentice Hall of India. 2) A. Malvino and David J Bates, "Electronic Principles", McGraw Hill. 				
Mode of Evaluation	Written CT-I & II Final-Written Term End Examination				
Course delivery format	Primarily black board teaching and tutorial assignments				
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications				
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples				
Supporting Laboratory course					

Course code: IEE/PC/B/T/215	Digital Electronics	L T P C 3 1 0 4
Course Prerequisites		
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> positional number systems, radix conversions and several coding techniques. techniques of combinational logic design and logic minimization processes. programmable logic devices for integrated system designs. different logic families and their interfacing problems. sequential logic systems – both synchronous (Moore and Mealy machines) and asynchronous design techniques. 	
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: classify and describe various number systems and codes; (K1, K2, A1)</p> <p>CO2: explain operations related to binary arithmetic. (K2-describe, A1)</p> <p>CO3: sub-divide any given combinational system design problem into smaller modules and sub-modules, design and validate each of them, and finally combine them properly to accomplish the desired system performances. (K4, A2-validate)</p> <p>CO4: categorize different types of memory elements, integrate them to develop different sequential logic circuits. (K4, A2-model)</p>	
Unit I	Positional Number Systems and Codes: 4 hrs. : CO1 Number systems and codes - Positional number system, Radix conversion; Different types of BCD, ASCII, EBCDIC; Gray code; Gray to Binary and Binary to Gray conversion techniques.	
Unit II	Binary Arithmetic : 6 hrs : CO2 Binary Arithmetic - R's and (R-1)'s complement representation, Subtraction using 1's and 2's complement representation, Concept of overflow, BCD addition.	
Unit III	Combinational Logic Design : 18 hrs : CO3 Fundamental logic operators, Boolean Algebra. Combinational Logic Design – Definition, Truth Table, SOP and POS realization from truth table, Logic minimization using K-map, Minterms and Maxterms, Minimization with don't care terms, Quine-McClusky's tabular method of logic minimization, Concept of combinational hazard, Examples of combinational logic design : Adder / Subtractor circuits; 2's complement ripple carry adder/subtractor circuit, Parity generator/checker circuit, Circuit for Binary to Gray and Gray to Binary conversion. Encoder, Decoder, Demultiplexer and Multiplexer, Function realization using decoder and multiplexer. Programmable Logic Devices – PROM, PLA, PAL, FPGA. ROM and RAM. Integrated Circuit Logic Families - TTL, PMOS, NMOS, CMOS, ECL.	
Unit IV	Sequential Logic Design : 16 hrs : CO4 Sequential machine design - Concept of Moore and Mealy machine, State transition diagram and State transition table, Various memory elements, NAND-latch and its use, Clocked flip-flops, SR, JK, D, T. Timing constraints on edge triggered flip-flops; Changing one type of Flip-flop to another type, Design of sequence detector. Asynchronous and synchronous counter design. Different types of registers.	
Text Books	1) Digital Logic and Computer Design, M. M. Mano, Prentice-Hall Inc.	
Reference Books	1) Digital Electronics, G. K. Kharate, Oxford University Press. 2) Digital Logic Design Principles, N. Balabanian and B. Carlson, John Wiley & Sons. 3) Digital Electronics and Design with VHDL, V. A. Pedroni, Morgan Kaufmann Publishers	
Mode of Evaluation	Written CT-I & II Final-Written Term End Examination	
Course delivery format	Primarily black board teaching and tutorial assignments	
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials	
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples

Course code: IEE/ES/B/T/216	APPLIED FLUID MECHANICS	L	T	P	C
		3	0	0	3
Version No.					
Course Prerequisites	BS/MTH/T111, BS/MTH/T112, BS/PH/TP104				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • The concepts of fluid • Analysis of fluid • General concepts of laminar, turbulent and compressible flow • Fluid machinery 				
Course Outcome:	<p>On completion of the course the students will be able to</p> <p>CO1: Classify fluids based on properties and its application when fluid at rest. (K2)</p> <p>CO2: Develop the governing equations for different flow conditions and solve flow related problems. (K3, A2-show)</p> <p>CO3: Develop equations for compressible flow and solve numerical problems including compressors(K3, A2-show)</p> <p>CO4: Apply laws of fluid mechanics for pumps, hydraulic turbines and flow measuring devices (K3)</p>				
Unit I	Introduction : 12hr				
	Fluid properties, Fluid statics, Equation of continuity, Euler equation, Motion of confined fluid, Bernouli's equation, Principles of energy and momentum				
Unit II	Fundamental concepts of flow: 14hrs				
	Principles of energy and momentum, Laminar and turbulent flow, Reynold's number, Viscous flow through pipes, Hydraulic gradient, Turbulent flow through open conduits, Compressible flow				
Unit III	Different flow: 12hrs				
	Relationship equations, Mach. No., Flow through nozzles, Shock wave through convergent and divergent nozzles.				
Unit IV	Different fluid machinery: 10hrs				
	Fluid machinery - pumps, compressors, water turbines, fluid motors etc. Fluid flow measurements and instrumentation for open and closed conduits.				
Text Books	Applied Fluid Mechanics 7/E, 2014 , Robert L. Mott, Joseph A. Untener, Prentice Hall Applied Fluid Mechanics 3/E, 1990, Robert L. Mott, Merrill Publishing Company.				
Reference Books	Applied Fluid Mechanics for Engineers by Schobeiri Meinhard , The McGraw-Hill Company				
Mode of Evaluation	Written CAT-I & II and Assignments Final-Written Term End Examination				
Course delivery format	Primarily black board teaching and assignments				
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications				
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples				
Recommended by the Board of Studies on					
Date of Approval by the Academic Council					

Course code: IEE/PC/B/S/211	Digital Circuits Laboratory	L 0	T 0	P 3	C 1.5
Course Prerequisites					
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: apply and explain the concepts of minimized combinational logic design. (K3, A1)</p> <p>CO2: organize any given combinational system design problem into smaller modules and sub-modules, implement and validate each of them (K3, S2)</p> <p>CO3: implement different types of memory elements and examine their characteristics (A2, S2)</p> <p>CO4: integrate the memory elements to develop different sequential logic circuits and examine their performances. (K3, A2, S2-implement)</p>				
Syllabus :	<p>Design and verification (both logic as well as timing) of:</p> <ol style="list-style-type: none"> 1. A simple combinational logic, like De-Morgan's law, basic gates using universal logic gates. 2. Half adder, full adder circuits 3. Half subtractor, full subtractor circuits. 4. 4:1 multiplexer, 1:4 demultiplexer 5. 4-bit binary to gray and gray to binary code converters 6. 2-bit comparator 7. Clocked SR latch, JK latch. 8. Asynchronous up/down counter 9. Synchronous up/down counter

Course code: IEE/PC/B/IT/T/221	Data Structure, Algorithms & OOPs	L	T	P	C
		3	0	0	3
Course Prerequisites	ES/CM/TP104A				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • The concepts of Big Oh notation and analysis of complexities of algorithms • Realizing linear & nonlinear data structures and its usefulness. • Implementation of stacks, queues and its applications • Recognize binary trees and perform different types of operations on trees • Learning all sorting and searching algorithms. 				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Understand data structures their advantages, drawbacks its types and analyze algorithms (K2, K4, A1)</p> <p>CO2: Explain, apply and analyze different types of linear and non-linear data structures(A1, K3, K4)</p> <p>CO3: Explain and illustrate different techniques of searching and sorting and differentiate them in terms of performance (A1, A3, K2, K3)</p> <p>CO4: Explain, illustrate and recognize the basic features of classes, objects and encapsulation mechanisms. (A1, A3, K2, K3)</p> <p>CO5: Illustrate the extended features of OOPs (Inheritance, Polymorphism, Operator overloading) and apply them to solve practical problems. (K3, A2-show)</p>				
Unit I	<p>Introduction:</p> <p>Concepts of data structures, Abstract Data Type and Data Types.</p> <p>Algorithms and programs, Basic idea of pseudo-code, Introduction to Big Oh notation, use of order notations and related results, time complexity and space complexity, worst-case and average-case analysis of algorithms</p>				
Unit II	<p>Linear Data Structure I:</p> <p>Different Array representation row major, column major Sparse matrix - its implementation</p> <p>Linked List: Singly linked list, circular linked list, doubly linked list, linked list representation of polynomial and applications.</p>				
Unit III	<p>Linear Data Structure II:</p> <p>Stack and its implementations (using array, using linked list), applications. Queue, circular queue, de-queue. Implementation of queue- both linear and circular (using array, using linked list)</p>				
Unit IV	<p>Nonlinear Data structures:</p> <p>Basic terminologies, tree representation (using array, using linked list). Binary trees - binary tree traversal (pre-, in-, post- order), non-recursive traversal algorithms, expression tree.</p> <p>Binary search tree- operations (creation, insertion, deletion, searching). Height balanced binary tree – AVL tree (insertion, deletion with examples only).</p>				
Unit V	<p>Sorting Algorithms:</p> <p>Bubble sort and its optimizations, Insertion sort, Selection sort, Quicksort , heap sort (concept of max heap, application – priority queue), Merge Sort, Radix sort.</p>				
Unit VI	<p>Searching:</p> <p>Sequential search, Binary search, Interpolation search.</p>				
Unit VII	<p>Basic Programming Concepts:</p> <p>Data Types, Operators, Control Statements & Loops, Functions & Parameters, Arrays, Pointers & References, Class & Object, Abstraction / Encapsulation, Access Specifier , Static Member, Friend Function ,Constructor and Destructor</p>				
Unit VIII	<p>OOPs with C++:</p> <p>Function and Operator Overloading , Inheritance and Derived Class , Abstract Class, Runtime Polymorphism, Virtual Base Class, Overriding</p>				
Text Books	<ol style="list-style-type: none"> 1. Data Structures and Algorithms by Aho, Hopcroft & Ullman 2. Data Structures in C by Aaron M. Tenenbaum 3. Data Structures by S. Lipschutz 4. The C++ Programming Language by Stroustrup, Addison Wesley 5. Object Oriented Programming in C++ by R. Lafore, SAMS 				
Reference Books	<ol style="list-style-type: none"> 1. Data Structures in Java by Sahni 				

Course code: IEE/PC/B/T/222	Analog Integrated Circuits	L	T	P	C
		3	1	0	4
Course Prerequisites	IEE/PC/B/T/214				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • basic analog integrated circuits and their developments. • Operational Amplifier fundamentals. • basic analog systems both linear and non-linear, based on Operational Amplifiers. • active filters, oscillators and waveform generators. • limitations of practical Operational Amplifiers. • several usages of IC timer. • interfacing between analog and digital domains. 				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe the salient features of analog integrated circuits and the fundamentals of Operational Amplifier. (K1, A1)</p> <p>CO2: Construct and analyze various linear analog circuits, e.g. amplifiers, adder, instrumentation amplifiers, integrators, differentiators, etc. (K3, A2-examine)</p> <p>CO3: Construct and analyze various nonlinear analog circuits, e.g. comparators with positive feedback, multivibrators, oscillators, other waveform generators, active filters, precision rectifiers, etc. (K3, A2-examine)</p> <p>CO4: Describe the critical aspects of the limitations of practical Operational Amplifiers, study the timer circuits and DAC – ADC modules. (K1, A1)</p>				
Unit I	<p>Operational Amplifier Fundamentals: CO1 Amplifier Fundamentals, Op-Amp Characteristics. Op-Amp in open loop comparator mode, Different applications. Basic Op-Amp Circuits, V-I Converter with floating and grounded load.</p>				
Unit II	<p>Linear Op-Amp Circuits : CO2 Inverting and Non-inverting amplifiers, Adder, Current amplifier, Difference amplifier, Instrumentation amplifier. Analysis of some typical Op-Amp circuits. Ideal and Practical Integrators, Differentiators and solution of differential equations. Generalized Impedance Converter and RLC ladder simulation design.</p>				
Unit III	<p>Non-linear Op-Amp Circuits:CO3 Schmitt trigger and applications, Precision rectifiers, Peak detectors, S/H circuits. Active filters. Multivibrators :Astable, Monostable. Wien bridge oscillator, Triangular waveform generator, Saw-tooth waveform generator. Log/Antilog Amplifiers, Analog Multipliers and their applications.</p>				
Unit IV	<p>Practical Op-Amp limitations, Timer application and ADC-DAC: CO4 D.C errors, Slew rate, Frequency response, Noise effect. Integrated Circuit Timer 555 and its applications. Analogue to Digital Converters and Digital to Analogue Converters.</p>				
Text Books	1) Operational Amplifiers and Linear Integrated Circuits, R. F. Coughlin and F. F. Driscoll, Prentice-Hall of India Pvt. Ltd.

		3	1	0	4
Course Prerequisites	IEE/PC/B/T/213				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • The operating principles of sensors and systems used for the measurement of physical variables namely - force, torque, position, displacement, velocity, acceleration, and pressure. • Sensor signal conditioning and transmission techniques, selection criteria. • Application aspects of sensors and measurement systems used in professional practice, specifically in industrial automation. 				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Explain the analog electronic and pneumatic, signal transmission techniques and devices used in process industries.(K2-describe,A1)</p> <p>CO2: Describe the operating principle of sensors used to measure position, displacement, velocity and acceleration. (K2,A1)</p> <p>CO3: Describe the operating principles and outline the application aspects of pressure measurement systems.(K2, A1)</p> <p>CO4: Explain the operating principle of force and torque measurement systems.(K2-describe, A1)</p>				
Unit I	<p>Analog electronic transmitters & Pneumatic systems: CO1: 14hrs</p> <p>Introduction to electronic transmitters. Sensor linearization techniques, redundant measurement systems.</p> <p>Flapper-nozzle assembly. Pneumatic relays, air filter regulator, pneumatic force balance systems, introduction to compressed air supply systems.</p>				
Unit II	<p>Measurement of position, displacement, velocity, acceleration: CO2 : 14 hrs</p> <p>Limit switch, Proximity Sensors - Inductive, Photoelectric, Capacitive and Magnetic. Shaft encoders, Tachogenerators, Tachometers. stroboscopes. Accelerometers. Introduction to vibration measurement.</p>				
Unit III	<p>Measurement of pressure and vacuum: 16hrs: CO3</p> <p>Concept of absolute, gauge and differential pressure. Pressure units and measurement principles. Elastic pressure sensors: bourdon tube, bellows, diaphragm and capsule. Manometers. Pressure gauge. Pressure switch. Electronic pressure transmitters: capacitive, piezo-resistive and resonator type. Calibration of pressure measuring devices. Installation of pressure measuring devices in different services.</p> <p>Measurement accessories - chemical seal and snubbers.</p> <p>Vacuum measurement: Mcleod gauge, thermal conductivity and ionization gauge.</p>				
Unit IV	<p>Force and Torque measurement systems: 12hrs: CO4</p> <p>Strain gauge, strain gauge signal processing, Load cells: column, shear and bending beam type. magnetostrictive load cell. Introduction to industrial weighing systems and belt conveyor weighing systems. Weigh feeders. Principle of torque measurement in rotating shafts.</p>				
Text Books	<p>1) D.Patranabis, Principles of Industrial Instrumentation, Tata McGraw Hill.</p> <p>2) E.O. Doebelin: Measurement Systems Application and Design, Tata McGraw Hill.</p>				
Reference Books	<p>1) Liptak B.G, Instrumentation Engineers Handbook (Measurement), Chilton Book Co.,</p> <p>2) John G Webster, Measurement, Instrumentation and Sensors, Handbook, CRC Press</p> <p>3) Walt Boyes, Instrumentation Reference Book, Butterworth Heinemann.</p>				
Mode of Evaluation	<p>Written CT-I & II</p> <p>Final-Written Term End Examination</p>				
Course delivery format	<p>Presentations, black board teaching and educational videos.</p>				
Supplementary academic support	<p>Providing links to webinars, white papers on the subject matter from leading Industrial houses.</p>				
Other learning activities	<p>Occasional plant visits and lectures by Industry experts.</p>

Recommended by the Board of					

Course code: IEE/PC/B/T/224	Linear Control Systems	L	T	P	C
		3	1	0	4
Course Prerequisites	BS/MTH/T111, BS/MTH/T122, FET/BS/B/Math/T/211, IEE/PC/B/T/212				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • feedback control loop, its characteristics and the control components in various practical instruments. • time and frequency responses of various systems to different inputs, their control interpretations and interrelations. • system stability analysis, computation of stability margins and their relation to transient responses. • single loop controller design using lead/lag compensation while accounting for performance criteria, costs and constraints. 				
Course Outcome:	<p>On completion of the course, the students should be able to</p> <p>CO1: Describe some common practical control systems including its components and develop mathematical models of given physical systems stating assumptions. (K3, A1)</p> <p>CO2: Describe and illustrate the time and frequency responses of various systems to different inputs. (K3, A1)</p> <p>CO3: Analyze the stability of control systems using their time-domain or frequency-domain responses. (K4, A3-adapt)</p> <p>CO4: Analyze experimental data and design and develop SISO controllers from technical specifications of control systems. (K5, A4)</p>				
Unit I	<p>Introduction : 10hrs: CO1</p> <p>Control systems, Physical elements of a control system, Abstract elements of a control system, The design process. Laplace transfer functions. Mathematical Model of Physical Systems: Introduction, Differential equation representation of physical systems, Transfer function concepts, Block diagram algebra, Signal flow graphs. Review function, domain, range, linearity.</p>				
Unit II	<p>Basics of Control Systems : 8hrs: CO1</p> <p>State variable representation: State variable model. Concept on Controllability and Observability, State models of linear continuous-time systems, Illustrative examples. Feedback Characteristics: Introduction, Reduction of parameter variation by use of feedback, Control of system dynamics by use of feedback, Control of effects of disturbance signals by use of feedback, Regenerative feedback, Illustrative examples. Control System Components: Introduction, DC servomotors, DC tacho-generators, AC servomotors, AC tachogenerators, Stepper motors, Accelerometer, LVDT.</p>				
Unit III	<p>Time Response Analysis : 8hrs: CO2, CO4</p> <p>Introduction, Standard test signals, Performance indices, Time response of first order system, Time response of second order systems, Design specifications of second order systems, Compensation schemes, Tacho output rate feedback, integral compensation, Design specifications of higher order systems.</p>				
Unit IV	<p>Stability Analysis in Time Domain : 8hrs: CO3, CO4</p> <p>The concept of stability, Assessment of stability from pole positions, Necessary conditions for stability, Routh stability criterion, Relative stability analysis, Illustrative examples-effect of K. The root locus concept, Root locus construction rules, Root contours, Case studies.</p>				
Unit V	<p>Frequency Response Analysis : 8hrs: CO3, CO4</p> <p>Introduction, parallels from time domain analysis, Performance indices, Frequency response of second order systems, Polar plots, Bode plots, All pass systems, Minimum-phase and Non-minimum-phase systems-significance, Illustrative examples.</p>				
Unit VI	<p>Stability Analysis in Frequency Domain : 8hrs: CO3, CO4</p> <p>Introduction, A brief review of principle of argument, Nyquist stability criterion, Assessment of relative stability – Gain Margin and Phase Margin using Nyquist criterion, Closed loop frequency response, Illustrative examples.</p>				
Unit VII	<p>Introduction to Design : 6hrs: CO4</p> <p>The design problem, Concepts of cascade and feedback compensation, Realization of basic compensators, Case studies.</p>				
Text Books	<p>1) Automatic Control Systems, B. C. Kuo, Prentice-Hall Inc. (3rd.ed.) 1975. 2) Modern Control Engineering, D. Roy Choudhury, Prentice-Hall Inc., 2005.</p>				
Reference	<p>1) Modern Control Engg, K. Ogata, Prentice-Hall Inc. (3rd.ed.), 1997.</p>				

Course code: IEE/PC/B/T/225	Digital Signal Processing	L T P C 3 0 0 3
Course Prerequisites	BS/MTH/T/111, BS/MTH/T/122, FET/BS/B/Math/T/211	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Concept of Discrete and Digital Signals and Systems, its comparison with analog counter part • Different Transforms in discrete domain: Discrete Fourier Transform (DFT), Fast Fourier Transform, Z-Transform • Design of Digital Filters: General, FIR, IIR • Filter structure and its usage • Effect of Finite word length 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe and interpret the mathematical models of discrete time signals and systems (K2, A1)</p> <p>CO2: Calculate and interpret Fourier transform and Z transform of signals and systems (K3, A1-explain)</p> <p>CO3: Design and examine digital filters (K5, A3-differentiate)</p> <p>CO4: Understand and recognize the importance of multi-rate digital signal processing (K2, A1)</p>	
Unit I	Introduction : 4hrs :CO1 Description of signals and systems: types of signals and their characteristics, types of systems and their behavior, discrete-time description of signals: discrete-time sequences, their frequency domain behavior, comparison with analog signals, sampling a continuous function to generate a sequence, reconstruction of continuous-time signals from discrete-time sequences, Illustrative examples	
Unit II	Description of discrete-time systems: 8hrs:CO1 Discrete-time description of systems: unit-sample response of a system, time-invariant systems, superposition principle for linear systems, stability criterion for discrete-time systems, causality criterion for discrete-time systems, linear constant-coefficient difference equations, convolution of two sequences, Illustrative examples.	
Unit III	Fourier transform: 8hrs :CO2 Discrete time Fourier transform: definition of Fourier transform (FT), important properties of FT, properties of FT for real-valued sequences, use of FT in signal processing, FT of special sequences, the inverse FT, FT of the product two discrete-time sequences, program to evaluate the FT by computer. Discrete Fourier Transform: The definition of the Discrete Fourier Transform (DFT), computation of the DFT from the discrete-time sequence, properties of the DFT, circular convolution, performing a linear convolution with the DFT, computations for evaluating the DFT, programming the DFT, increasing the computational speed of the DFT, intuitive explanation for the decimation-in-time FFT algorithm, analytic derivation of the decimation-in-time FFT algorithm, some general observations about the FFT, Illustrative examples.	
Unit IV	Z-transform: 6hrs: CO2 Z-transform: Definition of the z-transform, properties of the z-transform, the system function of a digital filter, combining filter sections to form more complex filters, digital filter implementation from the system function, the complex z-plane, the region of convergence in the z-plane, determining the filter coefficients from the singularity locations, geometric evaluation of the z-transform in the z-plane, relationship between the Fourier transform and the z-transform, the z-transform of symmetric sequences, the inverse z-transform, Illustrative examples.	
Unit V	Digital Filters: 12hrs :CO3 Definition and anatomy of a digital filter, frequency domain description of signals and systems, typical applications of digital filters, replacing analog filters with digital filters, filter categories, types of digital filter: FIR and IIR, recursive and non-recursive, digital filter structures: direct form I and II structures, cascade combination of second-order sections, parallel combination of second-order sections, linear-phase FIR filter structures, frequency-sampling structure for the FIR filter, Effect of word length: round off error, truncation error, quantization error, limit cycle, Illustrative examples.	
Unit VI	Multi-rate DSP:6hrs:CO4	

Course code: IEE/PC/B/T/226	Measurements and Electronic Instrumentation	L	T	P	C
		3	0	0	3
Course Prerequisites	IEE/PC/B/T/212, IEE/PC/B/T/213, IEE/PC/B/T/214, IEE/PC/B/T/215				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> Working principles of different types of electrical and electronic meters and their applications. Working principles of different types of electronic instruments like oscilloscopes, function generators, LCR meter. Data transmission standards and ports of the measuring instruments Basic concepts of virtual instrumentation. 				
Course Outcome:	<p>On completion of the course the students will be able to</p> <p>CO1: Describe electrical and electronic voltmeters and ammeters and measurement procedures of resistance, capacitance and inductance (K2,A1).</p> <p>CO2: Explain the functions of a potentiometer, wattmeter, energy meter, oscilloscope (K2-describe, A1)</p> <p>CO3: Explain the sources of interference signals and the methods of elimination (K2-describe, A1)</p> <p>CO4: Describe the commonly used data transmission standards and virtual instrumentation system (K2,A1)</p>				
Unit I	Introduction to electrical voltmeters and ammeters: CO1: 6hrs PMMC, MI, Electro dynamometer: Construction, range extension				
Unit II	Measurement of Resistance, Inductance and Capacitance: CO1: 6hrs Measurement of Resistance: Wheatstone bridge & Kelvin's Double bridge (DC Bridge), Loss of charge method, Megger Measurement of Capacitance: De Sauty's bridge & Schering bridge (AC Bridge) Measurement of Inductance: Maxwell's inductance capacitance bridge (AC Bridge)				
Unit III	PLL, Potentiometer, Wattmeter, Energymeter: CO2: 4hrs PLL : Block diagram, circuit diagram, PLL as a frequency synthesiser, Charge amplifier Basic concept of Potentiometer, Wattmeter and Energy meter				
Unit IV	Electronic voltmeter, ohmmeter, frequency meter, Q-meter: CO1: 8hrs Analog electronic voltmeter – AC and DC, True RMS voltmeter, Digital Voltmeter, Digital frequency meter, Q Meter				
Unit V	Oscilloscope: CO2: 10 hours Oscilloscope Time Base, Triggering, Oscilloscope Controls, Oscilloscope Probes, Digital Storage Oscilloscope				
Unit VI	Interference Signals and Data transmission standards: CO3: 6 hours Resistive, capacitive, inductive and ground loop interference and their elimination methods, Serial data transmission standards: RS232, RS422, RS 485 Parallel data transmission standards: IEEE 4888				
Unit VII	Introduction to Virtual Instrumentation systems: CO4: 4 hours				
Text Books	<ol style="list-style-type: none"> Golding E.W. & Widdis F.C. : Electrical Measuring Instruments & Measurements; Wheeler Helfrick A.D. & Cooper W.D. : Modern Electronic Instrumentation & Measuring Instruments; Wheeler Bell, David : Electronic Instrumentation & Measurement, Reston Publishers D.C. Other learning activities					

Course code: IEE/PC/B/S/221	Analog Electronics Laboratory	L 0	T 0	P 3	C 1.5
Course Prerequisites					
Course Outcomes:	On completion of the course, the students will be able to CO1: Implement and analyze diode and transistor amplifier circuits. (S2,A3-analyze) CO2: Implement and analyze linear circuits with op-amp. (S2,A3-analyze) CO3: Implement and analyze oscillator and nonlinear circuits using op-amp. (S2, A3-analyze) CO4: Implement and explain 555 Timer based circuits. (S2, A1)				
Syllabus :	<ol style="list-style-type: none"> 1. Study of clipping and clamping circuits 2. Study of DC and AC analysis of BJT and FET amplifiers. 3. Study of parameters of practical op-amp 4. Use of op-amps- Non-inverting and Inverting amplifier, buffer, adder, subtractor 5. Differentiators, Integrators 6. Multivibrators using op-amps. 7. Astable & monostable multivibrators using IC 555 8. Wien Bridge Oscillators. 9. Study of precision rectifiers. 10. Triangular Wave Generator.

Course Prerequisites	IEE/PC/B/T/212, IEE/PC/B/T/223, IEE/PC/B/T/224	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Development of mathematical models to describe the dynamics of processes • Design of process controllers and their tuning • Dynamic behaviour of closed-loop control systems • Final control elements 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Develop mathematical models of typical processes (K3, A2-model)</p> <p>CO2: Explain and analyse the performance of different controllers and their tuning methods (K4,A2-examine)</p> <p>CO3: Differentiate between various control schemes and interpret their necessity (K4,A3)</p> <p>CO4: Explain the role of final control elements in process control systems (K2, A1)</p>	
Unit I	<p>Introduction : 10hrs : CO1</p> <p>The basic concepts of process control, different blocks in the loop. Process variables, Process modeling principles and techniques, Modeling considerations for control purposes, degree of freedom analysis. Development of process models, Model order reduction, linearization of nonlinear process models.</p>	
Unit II	<p>Control actions: 10hrs: CO2, CO3</p> <p>Modes of control actions – on-off, P, PI, PID, Different forms of PID controllers, Characteristics of process response under different types of controllers, Reset windup. Positional and velocity form of PID controllers. Auto/manual transfer.</p>	
Unit III	<p>Schemes and analysis of process control strategies: 20hrs: CO2, CO3</p> <p>Behavior of a typical closed-loop process control systems. PID control – design and tuning, Feedforward control, Ratio control, Cascade control, Split-Range control, Selector control, Antireset control. Dead-time compensation – Smith predictor.</p>	
Unit IV	<p>Final control elements: 10hrs : CO4</p> <p>Final control elements – actuators and control valves, valve positioners. Characteristics of control valves – inherent and installed characteristics. Sizing and selection criteria of control valves. Cavitation and flashing .</p>

Course code: IEE/PC/B/T/316	Signal Transmission and Communication Systems	L T P C 3 0 0 3
Course Prerequisites	BS/MTH/T111, BS/MTH/T122, FET/BS/B/Math/T/211, IEE/PC/B/T/212, IEE/PC/B/T/214, IEE/PC/B/T/215	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Concept of signals and different mathematical operations on it • Amplitude and angle modulation and demodulation • AM, FM Transmitter and receiver • Concept of transmission line, characteristics • Antenna fundamentals and wave propagation 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Define, classify different types of signals and calculate Fourier series and Fourier transformation on signals. (K2, A1-recognize)</p> <p>CO2: Describe amplitude, angle modulation and demodulation techniques (K1, A1)</p> <p>CO3: Demonstrate the basic characteristics and comparisons of different AM and FM transmitter and receiver (K3, A2-show).</p> <p>CO4: Define, classify transmission lines, describe different types of antennas and wave propagation (K2, A1)</p>	
Unit I	Representation of signals: 4 hrs. : CO1 Representation of signals; Generalized periodic waveforms, trigonometric and exponential Fourier series, Fourier transform, Convolution, Correlation, Energy and power spectral densities.	
Unit II	Modulation techniques : 16 hrs : CO2 Amplitude modulation - representation, frequency spectrum, power relations; Generation of AM, linear and nonlinear modulation; Single sideband (SSB) techniques - generation, carrier suppression, suppression of unwanted sideband, extensions of SSB, pilot carrier systems, vestigial sideband transmission. Frequency modulation - Theory of FM and PM, Generation of FM, Pre-emphasis and de-emphasis, Circuit schemes and comparisons, VCO's - circuits and applications.	
Unit III	Transmitters and receivers: 8 hrs : CO3 AM and FM transmitters - basic characteristics and comparisons, different transmitter types; Receivers - Super heterodyne types; AM receivers – Frequency changing and tracking, Mixers and converters, Detection and AGC, communication receivers; FM-receivers - common schemes, comparison with AM types, Amplitude limiting, different demodulator/detector circuits.	
Unit IV	Transmission line: 16 hrs : CO4 Theory of transmission line - General solution, lumped and distributed parameters, the infinite line, propagation velocity, waveform distortion, distortion less line, reflections, insertion loss, equivalent sections, terminations, characteristic impedance, Smith Chart applications; load matching techniques, microwave waveguides, antenna fundamentals, Radiation Pattern, Dipole, Folded dipole, Yagi-Uda, Log-periodic, Spiral antennas. Surface wave propagation, Ionospheric propagation.

Course code: IEE/PC/B/S/311	Control Systems Laboratory	L	T	P	C
		0	0	3	1.5
Course Prerequisites					
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Conduct an experiment to review a position control system using an inner velocity feedback loop and outer position feedback loop (K2, A2-examine, S2)</p> <p>CO2: Identify a 2nd order model of an active filter circuit from its step response and find out the system parameters from its time response analysis. (K3, A3-recognize, S2-perform)</p> <p>CO3: Conduct an experiment to review the operation of a stepper-motor in open loop and its driver circuit (K2, A2-examine, S2)</p> <p>CO4: Based on MATLAB simulations, investigate the following: (i) Proportional and derivative control effect (ii) Effect of forward-path Lead Compensation on the performance of a position control servo-system. (K4, A2-examine, S3-demonstrate)</p> <p>CO5: Demonstrate the steady-state and transient performance of a nonlinear feedback control system, employing P and PI-type control, by using its small-signal linear model. (K3, S3)</p>				
Syllabus :	1. Study of a DC Position Control System 2. Identification of the 2 nd -order Model of a Linear System from Step Response Test 3. Study of a Stepper Motor and its Translator 4. Study of Step Response of a Linear 2 nd order System using MATLAB 5. Simulation Study on Effects of Compensation Networks. 6. Study of a Illumination Control System

Course Prerequisites	IEE/PC/B/T/223				
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Calibrate and explain the features an analog two wire transmitter(A1,S3)</p> <p>CO2: Interpret the data-sheets, calibrate and evaluate the performance of position, displacement, velocity, acceleration & force sensors(A2-examine,S3)</p> <p>CO3: Calibrate and evaluate the performance of pressure and Temperature Sensors/transmitters(A2-examine,S3)</p> <p>CO4: Configure/parameterize HART compliant Smart transmitters (A5-Characterize, S5-Construct)</p>				
Syllabus :	<ol style="list-style-type: none"> 1. Testing, evaluation and calibration of a 2-wire V to I converter. 2. Study, calibration and signal conditioning of an LVDT. Study of inductive, capacitive, optical and magnetic proximity sensors. 3. Measurement of RPM using incremental shaft encoder, proximity sensor and stroboscope. Vibration monitoring using proximity sensor and accelerometer 4. Calibration of a pressure gauge, pressure switch and a DP transmitter using a pneumatic calibrator / dead weight tester. 5. Calibration of temperature sensors and transmitter and study differential pressure flow elements. 6. Study and calibration of a load cell and testing of the associated electronics used to construct a weighing system. 7. Configuration and parameterization of a HART compliant, smart differential pressure / temperature transmitter 8. Study of pH/Conductivity measurement systems

Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Discrete-time control systems; Analysis of SISO process control loop including stability analysis by z-transform technique. • Digital implementation of PID controller and design of digital controllers. • Multivariable and Adaptive control systems. • Fuzzy and Neuro-Fuzzy Control systems. 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Explain the various operational steps of digital control systems. (K2-describe, A1)</p> <p>CO2: Explain the dynamic and steady state behavior of discrete-time control systems. (K2-describe,A1)</p> <p>CO3: Explain the role of multivariable and adaptive control systems. (K2- describe, A1)</p> <p>CO4: Discuss intelligent control systems with fuzzy and neuro-fuzzy models. (K2 describe, A2)</p>	
Unit I	<p>Introduction to Discrete-Time Control Systems : 10hrs : CO1</p> <p>Sampled-data control system: Digital Computer as a controller in process control loop, advantages and disadvantages of sampled-data control systems, discrete time signal, sampling of continuous signal, signal reconstruction – zero-order and first-order holds, modeling of digital control systems – models for ADC and DAC, solution of difference equation using z-transform. Overview of computer process control systems.</p>	
Unit II	<p>z-Plane Analysis of Discrete-Time Control Systems : 24hrs : CO2</p> <p>Pulse transfer function, analysis of SISO process control loop by z-transform technique, z-and s-domain relationship, stability analysis of discrete systems, Jury's stability test, stability analysis by using Bilinear transformation, steady state error analysis of sampled data control systems, Digital implementation of PID controllers, Design methods of sampled data control systems. Discrete state space models. Controllability and observability of discrete time systems.</p>	
Unit III	<p>Basics of Multivariable and Adaptive Control Systems : 12hrs : CO3</p> <p>Multivariable control system: Loop interaction, Pairing controlled and manipulated variables, Design and tuning of Decouplers, Tuning multivariable control systems. Concepts of Adaptive control – gain scheduling, self-tuning and model reference adaptive control, Case studies on adaptive PID controllers.</p>	
Unit IV	<p>Fuzzy and Neuro-Fuzzy Control: 10hrs : CO4</p> <p>Overview of fuzzy logic: Fuzzy set, Membership function, Fuzzy Rules, Fuzzy inference. Fuzzy logic controller (FLC) – block diagram and computational steps, design steps of FLCs, merits and limitations of FLC design. Adaptive Fuzzy controllers. Neuro-fuzzy control: Models of a neuron, Multilayer feedforward networks – architecture and learning, models of neuro-fuzzy control systems and computational steps.</p>	
Text Books	<p>1) Discrete-Time Control Systems, K. Ogata, Prentice-Hall Inc. (2nd .ed.) 1995</p> <p>2) Process Dynamics and Control, Dale E. Seborg, Duncan A. Mellichamp, Thomas F. Edgar, Francis J. Course Prerequisites	ES/BE/T102B, IEE/PC/B/T/214	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Basic principles of power electronic devices like diodes, transistors and thyristors. • Single phase and polyphase converter and inverter circuits. • Speed control techniques of AC and DC motors. • Switched mode power supplies and uninterruptible power supplies. 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe the working principles and usability of the different power electronic devices like diodes, transistors and thyristors. (K2, A1).</p> <p>CO2: Explain the working principle of single phase and polyphase converter and inverter circuits. (K2-describe, A1).</p> <p>CO3: Describe the speed control techniques of AC and DC motors..(K2, A1)</p> <p>CO4: Explain the working principle of switched mode power supplies and uninterruptible power supplies. (K2-describe, A1).</p>	
Unit I	Different power electronic devices like diodes, transistors and thyristors: 16 hrs: CO1 Power Semiconductor Devices: Rectifier diodes, fast recovery diode and Schottky barrier diode. Power BJT and power Darlington transistors, Power MOSFET. The thyristor family: SCR, triac, inverter-grade SCR, asymmetric SCR, reverse-conducting thyristor (RCT) and gate turn-off thyristor (GTO). SCR turn-on and turn-off methods. Insulated gate bipolar transistor (IGBT). Common triggering devices and their applications: UJT, diac and PUT.	
Unit II	Single phase and polyphase converter and inverter circuits : 20 hrs : CO2 Phase-controlled Rectification and Inversion: Single-phase converter circuits. Polyphase converters: delayed commutation and commutation overlap, phase-controlled inverter, reactive power and power factor, free-wheeling operation, three-phase full-wave bridge converter, halfcontrolled bridge converter, regenerative converters.	
Unit III	Speed control techniques of AC and DC motors : 8hrs : CO3 Introduction to AC motor speed control and introduction of DC motor speed control.	
Unit IV	Switched mode power supplies and uninterruptible power supplies : 4hrs : CO4 Introduction to switched mode power supplies and uninterruptible power supplies.

Course Prerequisites	IEE/PC/B/IT/T/312				
Objectives:	<p>This course aims to provide due coverage of:</p> <p>Basic concepts of networks and communication protocol. Use of Ethernet as a LAN communication protocol and additional considerations for its use in an industrial environment. Basic aspects of Transmission Control Protocol/ Internet Protocol from a structural and service perspective. The basic functional & application aspects of popular control and field device networks used in industrial automation.</p>				
Course Outcome:	<p>On completion of this course, students will be able to:</p> <p>CO1: Explain basic networking concepts and functional /deployment aspects of Ethernet as a LAN communication protocol. (K2-describe, A1) CO2: Describe the basic functional aspects of a TCP/IP network. (K2, A1) CO3: Explain the basic operational and application aspects of industrial control networks. (K2-describe, A1) CO4: Describe the basic operational and application aspects of industrial field device networks. (K2, A1)</p>				
Unit I:(CO1 :: 9hrs)	<p>Basics of Industrial Networking& Ethernet:</p> <p>Industrial networking concepts, differences between enterprise and industrial networks, network topology, OSI layered protocol model. Ethernet: Media, physical interface, speed, IEEE standards, data encoding and transmission. Ethernet frames, MAC address, error detection and correction, flow control. Ethernet half duplex mode: multiple access protocols, CSMA/CD, media converter and Hub. Full duplex: auto-negotiation duplex mismatch. Ethernet switch - functions, auto-crossing/auto-polarity. Partitioning of the network. Industrial Ethernet architectures for high availability: MRP (Media Redundancy Protocol), PRP (Parallel Redundancy Protocol), HSR (High Availability Seamless Redundancy), RSTP (Rapid Spanning Tree Protocol), link aggregation. Data traffic management at layer2: Data rate, Flow Control, Quality of Service, VLAN. Industrial Ethernet: deterministic versus stochastic operation, size and overhead of Ethernet frame.</p>				
Unit II:(CO2 :: 9hrs)	<p>TCP / IP Networks:</p> <p>TCP/IP protocol model. Internet Protocol: IP Packets, IP-addresses and Netmask, Classless Inter Domain Routing (CIDR). Address Resolution Protocol (ARP), Internet Control Message Protocol(ICMP), static routing. TCP and UDP – Ports and services, Datagrams. Basic concepts of Simple Network Time Protocol (SNTP), Precision Time Protocol (PTP), Simple Network Management Protocol (SNMP), Dynamic Host Configuration Protocol (DHCP). Multicasting: multicasting address, mapping IP addresses to MAC address, The Internet Group Management Protocol (<i>IGMP</i>).</p>				
Unit III:(CO3::12 hrs)	<p>Industrial Control Networks:</p> <p>Functional overview and fundamental application aspects of popular Ethernet based industrial control networks - Profinet& Ethernet/IP, and legacy control level networks Modbus, Profibus-DP, DeviceNet. Introduction to Wireless network for supervisory control, distributed I/O and mobile operator (HMI) - IEEE 802.11a/g/n.</p>				
Unit IV:(CO4::12 hrs)	Field Control Networks:				

Course code: IEE/PE/B/T/32D	Functional Safety & Safety Instrumented Systems	L	T	P	C
		3	0	0	3
Course Prerequisites	IEE/PC/H/T/313, IEE/PC/H/T/315				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Introduction to functional safety, relevant standards and the concept of process hazard and risk analysis. • To discuss the principles of risk reduction, role of safety instrumented systems (SIS) and the concept of safety integrity level (SIL). • SIS design, operation and maintenance concepts. 				
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe the concept of functional safety, outline relevant standards and explain methodologies of process hazard and risk analysis. (K2, A1)</p> <p>CO2: Explain the principles of risk reduction and the use of SIS to minimize risk to a tolerable level and the concept of SIL. (K2, A1)</p> <p>CO3: Describe the SIS design principles to achieve a desired SIL. (K2, A1)</p> <p>CO4: State the basic operation and maintenance aspects of SIS. (K1, A1-explain)</p>				
Unit I	<p>Concept of functional safety, outline relevant standards and methodologies of process hazard and risk analysis : 12 hrs, CO1</p> <p>Fundamentals of functional safety, overview of standards IEC 61508 and 61511. Safety life cycle. Hazard, risk and their assessment. Process hazard analysis (PHA) – HAZOP (hazard and operability study), what-if/checklists, FMEA (failure mode and effect analysis). Principles of risk reduction, concept of a tolerable risk, as low as reasonably practicable (ALARP), layers of protection, layer of protection analysis (LOPA).</p>				
Unit II	<p>Principles of risk reduction and use of SIS to minimize risk to a tolerable level and concept of SIL. : 8hrs CO2</p> <p>Use of safety instrumented functions (SIF) for achieving a tolerable risk. Basic process control system (BPCS) and SIS comparisons. Risk Reduction Factor (RRF), Safety Integrity Level (SIL) and determination of target SIL level of SIFs to achieve tolerable risk.</p>				
Unit III	<p>SIS design principles: 18hrs CO3</p> <p>Failure modes (safe, dangerous, detected & undetected, common cause failures) and best practices for minimizing them. SIS subsystems - sensor, logic solver and actuator. SIS design concepts to achieve a desired SIL. Hardware safety integrity, systematic safety integrity, architectural constraints. Hardware design, low and high demand, target failure measure (PFDavg, PFH), redundancy, voting, diversity hardware fault tolerance, diagnostic tests, safe failure fraction. Hardware reliability, software design.</p>				
Unit IV	<p>Basic operation and maintenance aspects of SIS :4 hrs CO4</p> <p>SIS operation, maintenance and modification procedures. Proof testing.</p>				
Text Books	1) Safety Instrumented Systems: Design, Analysis, and Justification, by Paul Gruhn, Harry L. Cheddie, published by ISA.				
Reference Books	1) IEC standard 61508 and 61511 documents.				
Mode of Evaluation	Written CT-I & II Final-Written Term End Examination				
Course delivery format	Power point teaching and assignments				
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications				
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples				
Supporting Laboratory course					

Course code: IEE/PE/B/T/32E	Analog MOS Circuit Design	L	T	P	C
		3	0	0	3
Course Prerequisites	ES/BE/T/102B, IEE/PC/B/T/214				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Behavior and characteristics of MOSFET • Operating principles of MOS amplifier circuits • Construction and working principle of differential amplifier and current mirror circuit • Frequency response of MOS amplifiers 				
Course Outcome:	<p>On completion of the course, the students should be able to</p> <p>CO1: Classify and analyze different types of MOS amplifiers (K4, A1-recognize)</p> <p>CO2: Explain and interpret the importance of differential amplifiers (K3, A1)</p> <p>CO3: Describe and explain the behavior of current mirrors (K2, A1)</p> <p>CO4: Explain and analyze the frequency response of MOS amplifiers (K4, A1)</p>				
Unit I	Introduction: 6 Hrs:: CO1				
	Review of MOS device physics, general considerations, MOS I/V characteristics, second order effects.				
Unit II	Single Stage MOS Amplifiers:12Hrs:: CO1				
	Basic concepts, Common source stage with different types of load, Source follower, Common gate stage, cascode stage, Illustrative examples.				
Unit III	Differential Amplifiers:10Hrs:: CO2				
	Basic differential pair, Common mode response, Differential pair with MOS loads, Illustrative examples.				
Unit IV	Current Mirrors: 6Hrs:: CO3				
	Basic current mirrors, Cascode current mirrors, active current mirrors, Illustrative examples.				
Unit V	Frequency Response of MOS Amplifiers: 8 Hrs:: CO4				
	General considerations, High frequency models of common source, source follower and common gate amplifier, Frequency response of cascode stage, Illustrative examples.				
Text Books	1. Behzad Razavi, "Design of Analog CMOS Integrated Circuit", McGraw Hill.				
Reference Books	1. Y. P. Tsividis, "Operation and Modelling of MOS Transistor", McGraw Hill. 2. Phillip E. Allen and Douglas R Holberg, "CMOS Analog Circuit Design", Oxford University Press.				
Mode of Evaluation	Written CT-I & II Final-Written Term End Examination				
Course delivery format	Primarily black board teaching and tutorial assignments				
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications				
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples

Course code: IEE/PC/B/ T/411	Telemetry and Remote Control	L T P C 3 0 0 3
Course Prerequisites	IEE/PC/B/T/316	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Concept of signals and different mathematical operations on it. • Concept of data transmission, line and error control coding. • Concept of wireless wave propagation • Different types modulation and multiplexing techniques • Concept of satellite and fiber optics telemetry 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Examine and identify telemetering signals and their transforms. (A2, K4)</p> <p>CO2: Examine, identify and apply data transmission, line and error control coding techniques. (A2, K4)</p> <p>CO3: Discuss and interpret basic characteristics of modulation, multiplexing, FDM and TDM Systems, Modems, wireless wave propagation techniques. (K3, A2).</p> <p>CO4: Describe and classify satellite and fiber optics telemetry (K2, A1)</p>	
Unit I	<p>Basic Concept: Telemetering Signals and their Transforms: 8 hrs. : CO1</p> <p>Basic Concept: Telemetry- its purpose and application potential, basic schemes- pneumatic, current, voltage, frequency over short distances. Line length limitations; Wired and wireless types.</p> <p>Signals and Transforms: Signals and their representation and transformation; Frequency spectra of pulses and pulse waveforms; continuous and discrete transforms; Noise- its distribution; Probability function.</p>	
Unit II	<p>Codes and Coding: 8 hrs: CO2</p> <p>Concepts of information transfer, bits and symbols; coding source, line and channel; biasing. BCD, ASCII, EBCDIC, BAUDOT; AMI, CMI, Manchester (phase), HDBn, Block; Differential, LRC, Hamming, Convolution, M-ary; modulation Codes: PAM, PFM, PTM (PPM,PWM), PCM. Bit error rate, Parity checking, Effect of time delays and noise in bit information; Raised Cosine Spectrum and response; Noise induced bit errors etc.</p>	
Unit III	<p>FDM and TDM Systems, Modems, wireless wave propagation techniques: 20 hrs: CO3</p> <p>FM, PM, FM-FM, FM-AM, PAM-AM, PAM-FM, PCM-AM, PCM Sample and hold circuits, Quantization and Conversion methods, Errors in quantization; Bandwidth consideration.</p> <p>FDM and TDM Systems: Frequency division multiplexing and demultiplexing Systems, IRIG Standards in FDM telemetry; SCO's and their circuits- Multiplexing and Demultiplexing circuits; Detectors and Demodulators, Pulse Averaging, Quadrature FM and PLL; Mixers. TDM Systemstheir circuits, scanning techniques; TDM-PAM, PAM-PM Systems, Synchronization, TDM-PCM System; PCM Generation, Differential PCM Systems, PCM reception and demodulation</p> <p>Modems: Digital modulation and shift keying techniques, ASK, OOK, FSK, PSK, DPSK, QPSK, etc, QAM; Modem Protocols, Synchronous protocols.</p> <p>Wave Propagation: Aspects of wave propagation; Space</p>	
Unit IV	<p>Satellite, Optical Telemetry: 8 hrs : CO4</p> <p>Satellite Telemetry: Basics, TT&C Services and subsystems, the Subsystems, The earth station. Fiber Optic Telemetry: Optic fiber as a transmission medium; Interconnections; Repeaters; Source and Detectors; Receivers, wavelength division multiplexing.</p>

Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Understanding of the functional operation of a variety of techniques specific to intelligent control systems • The control/theoretic foundations • Analytical approaches to study their properties • Development of intelligent control systems 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Discuss the various approaches of Intelligent control systems for engineering problems. (K2-describe,A2)</p> <p>CO2: Describe the design aspects of fuzzy logic controllers and their different operational modes. (K2, A1)</p> <p>CO3: Explain the functional operation of different neural network models and neuro-fuzzy control systems. (K2-describe, A1)</p> <p>CO4: Discuss some nature inspired algorithms based optimization of controller and model parameters. (K2-describe, A2)</p>	
Unit I	Introduction to Intelligent Control Systems; 6hrs: CO1 Intelligent control requirements and architectures. Approaches to intelligent control. Knowledge based systems. Soft computing constituents; Fuzzy Logic, Neural Networks, Genetic Algorithm. Soft computing tools in intelligent control systems. Fuzzy and neuro-fuzzy control. Optimization of intelligent control systems.	
Unit II	Fuzzy Logic System; 18hrs : CO2 Introduction to crisp sets and fuzzy sets, basic fuzzy set operation. Membership function formulation and parameterization; Fuzzy inference mechanisms. Introduction to fuzzy modeling and control: Fuzzification, inferencing and defuzzification. Structures of Fuzzy Control Systems: Mamdani fuzzy controllers; Takagi/Sugeno fuzzy controllers; Types of fuzzy controllers – PI/ PD/and PID. Tuning of fuzzy controllers. Stability analysis of fuzzy control systems. Adaptive fuzzy controllers: Self-tuning and Self-organizing fuzzy controllers. Fuzzy Rule generation/reduction by clustering techniques. Overview of Type-2 fuzzy systems: Type-2 fuzzy sets, Type-reducer, Interval Type-2 fuzzy controllers.	
Unit III	Neural Networks and Neuro fuzzy Systems; 12hrs : CO3 Concept of Artificial Neural Networks and its basic mathematical model, Supervised and unsupervised neural networks Feed-forward Multilayer Perceptron. Self-organizing network and Recurrent network. Neural Network based controller, Learning and Adaptation; Training neural networks and fuzzy systems with least squares and gradient methods; Adaptive hybrid neuro-fuzzy control systems.	
Unit IV	Nature inspired Optimization; 6hrs : CO4 Basic concept of Genetic algorithm and its algorithmic steps, Solution of typical control problems using genetic algorithm. Concept on some other intelligent optimization techniques and their applications for optimal tuning of controller parameters and model parameters.

Course Prerequisites	IEE/PC/H/T/313, IEE/PC/H/T/315	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • General concepts of different power plant setups, energy conversion process • Different types of instrumentation control system in power plant • Instrumentation for safety-interlocks, protective devices and monitoring of environmental pollution • Power plant simulators 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe the working principles and usability of the different power plant setups and energy conversion process (K2, A1).</p> <p>CO2: Explain the working principle of different types of instrumentation control system in power plant (K2-describe, A1).</p> <p>CO3: Describe instrumentation for safety-interlocks, protective devices and monitoring of environmental pollution.(K2, A1)</p> <p>CO4: Describe full functionality of power plant schemes and familiarization with interfacing using DCS (K2,A1).</p>	
Unit I	Different parts of power plant system : 18hrs : CO1 General concepts of different power plant setups and energy conversion process. Thermal power plant instrumentation –controlling, monitoring and testing of boilers, turbines, condensers, generators, coal-handling units and auxiliary systems, quality monitoring of air water and exhaust gas	
Unit II	Different power plants : 8hrs : CO2 Salient features of instrumentation in nuclear, hydroelectric and non-conventional power plants.	
Unit III	Safety measures : 8hrs : CO3 Instrumentation for safety-interlocks, protective devices; emergency measures; alarms and alarm analysis, monitoring of environmental pollution.	
Unit IV	Data handling systems : 8hrs : CO4 Data-handling systems-data acquisition, processing, accounting, logging and display-storage systems.	
Unit V	Basic concept of power plant simulators : 6hrs : CO4 Introduction to power plant simulators.	
Text Books	<p>1) The control of boilers, Sam G. Dukelow, 2ndedition, ISA, 1991.</p> <p>2) Power plant Engineering: Steam And Nuclea, P. K. Nag, Tata McGraw-Hill Education, 1998.</p>	
Reference Books	<p>1) Application Concepts of process control, Paul W. Murrill, ISA, 1998.</p> <p>2) Fundamentals of thermodynamics and heat engineering, V.G. Erokhin, M.G. Makhanko, P.I. Samoilenko, 1986.</p>	
Mode of Evaluation	Written CT-I & II and Assignments Final-Written Term End Examination	
Course delivery format	Primarily black board teaching and assignments	
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications	
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples	
Supporting Laboratory course		
Recommended by the Board of Studies on

Course code: IEE/PE/B/T/41D	Embedded Systems	L T P C 3 0 0 3
Course Prerequisites	ES/CM/TP104A, IEE/PC/B/T/215, IEE/PC/H/T/314	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • The basics of Embedded Systems and Real Time Systems. • The basics of embedded system development tools • Atmel RISC Processors • C programs for Microcontrollers • The basic concepts of RTOS • The fundamentals of embedded Linux. • The basics of a multicore microcontroller 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe basics of embedded system development tools and Atmel RISC Processors (K1, A1).</p> <p>CO2: Develop C programs for Microcontroller applications. (K3, A3-adapt).</p> <p>CO3: Describe concepts of RTOS (K1, A1).</p> <p>CO4: Describe fundamentals of embedded Linux (K1, A1).</p> <p>CO5: Describe fundamentals of multicore microcontrollers (K1, A1)</p>	
Unit I	ATMEL RISC Processors and Development Tools: 10 hrs CO1 Introduction, Basics of developing for embedded systems, Atmel RISC Processors Architecture, Memory, Reset and interrupt functions, Parallel I/O ports, Timer/Counters, Serial communication using UART, SPI, Analog Interfaces, Control statements, Multicore microcontroller.	
Unit II	Elements of C Programming and Preprocessor Functions: 10 hrs CO2 Variables and constants, I/O operations, Operators and Expressions, Functions, Pointers and Arrays, Structure and Unions, Memory types, Real time methods, Standard I/O and Preprocessor functions	
Unit III	IDE and Project Development: 10 hrs CO2 Code Vision AVR C Compiler and IDE: IDE Operation, C Compiler Options, Compile and Make Projects, Program the target device, AVR code generator, Atmel AVR Studio debugger, Project development: Process steps, Example Projects	
Unit IV	RTOS Internals: 10 hrs CO3 Introduction to RTOS: scheduler, objects, services, key characteristics, Tasks, Semaphores, Message queues, Pipes, Event Registers, Signals, Condition variables	
Unit V	Embedded linux 10 hrs CO4 Introduction - host-target development setup hardware support - development languages and tools – RT linux., Linux kernel and kernel initialization - system initialization – hardware support – bootloaders, Embedded development environment - GNU debugger - tracing & profiling tools - binary utilities - kernel debugging - debugging embedded Linux applications - porting Linux - Linux and real time - SDRAM interface	
Unit VI	Multicore Microcontroller: 8 hrs CO5 Propeller Chip, Introduction to Propeller Programming, Debugging Code for Multiple Cores	
Text Books	<p>1) Qing Li with Caroline Yao “Real-Time Concepts for Embedded Systems” CMP books 2011</p> <p>2) Barnett, Cox, & O’Cull “Embedded C Programming and the Atmel AVR” Thomson Delmar learning 2006</p>

		3	0	0	3
Course Prerequisites	IEE/PC/B/T/215, IEE/PC/B/T/222				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • various technologies of VLSI • fundamentals of chip fabrication and layout design rules • small device geometries • digital CMOS designs • fault models relevant to testing and testability 				
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Define various technologies for VLSI.(A1-describe, K1)</p> <p>CO2: Describe fundamentals of MOS fabrication & layout design rules.(A1,K2)</p> <p>CO3: Describe the physical limitations imposed by small device geometries and various second order effects in MOS.(A1,K2)</p> <p>CO4: Classify fault types and develop their modelling. (A4,K3)</p>				
Unit I	<p>Introduction to VLSI: 4 hrs. : CO1</p> <p>Categorization of Integrated Circuits; SSI, MSI, LSI, VLSI etc., Technologies for VLSI and their features: NMOS, CMOS, Bi-CMOS, GaAsMOSFET.</p>				
Unit II	<p>Fabrication of MOSFETs: 6hrs : CO2</p> <p>Diffusion, doping, oxidation, Epitaxial layer formation, photo, ion-beam and X-ray lithographies. Silicon, Aluminium, Copper and polysilicon etching. Local oxidation and dielectric isolation, ionimplantation. Outlines of Bipolar, MOS, CMOS and GaAs VLSI fabrication.</p>				
Unit III	<p>CMOS circuit design: 24hrs : CO3</p> <p>Basic structure of p-well CMOS Inverter, circuit operation, voltage transfer characteristics, calculation of critical points and their physical significance, noise margins, design of symmetric inverter, power dissipation issues, inverter capacitances, transmission gates and perfect signal steering, capacitance loads driven by transmission gates, NAND and NOR logic gates, stick diagrams, comparison of performances, derivation of combinational networks from canonic forms, AND-OR INVERT gate, complex gates, Sutton's method of network synthesis, combinational networks using Shannon's expansion theorem, MOS inverters driven by pass transistors two-input and two-variable universal logic modules, sequential MOS logic circuits, pre-charge and evaluation phases, pseudo-NMOS, Domino and NORA circuits, λ- based design rules. ROM, Multiplexer, PLA, PAL, CPLD and FPGA based implementation of VLSI, Verilog Programming</p>				
Unit IV	<p>Fault models: 8hrs : CO4</p> <p>Testing and testability, Different fault models; stuck-at, short circuit and open circuit faults. Automatic test pattern generator (ATPG).</p>				
Text Books	1) K.Eshraghian. D.A. Pucknell and S. Eshraghian, "Essential of VLSI Circuits and Systems", Prentice Hall of India Pvt. Ltd.				
Reference Books	<p>1) D.A.Pucknell and K.Eshraghian, "Basic VLSI Design", Prentice-Hall of India Pvt. Ltd</p> <p>2) J.P.Uyemura, "Chip design for Submicron VLSI: CMOS layout and Simulation", Thomson India Edition</p> <p>3) W. Wolf, "Modern VLSI design System- On chip Design", Pearson Education</p> <p>4) Sherwani NA. Algorithms for VLSI physical design automation. Springer Science & Business Media; 2012</p>

Course code: IEE/PE/B/T/41F	DIGITAL IMAGE PROCESSING	L	T	P	C
		3	0	0	3
Course Prerequisites	IEE/PC/B/T/225				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Extension of one dimensional signal processing into two dimensional signal processing for image analysis • Digital image acquisition and basic operations for enhancement of image quality • Spatial and frequency domain filtering of digital image • Color image acquisition and processing 				
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Classify and examine different types of image processing operations in spatial domain (K2, A2)</p> <p>CO2: Describe and explain the implication of image frequency in processing digital images (K2, A1)</p> <p>CO3: Describe the popular image processing algorithms and their applications (K2, A1)</p> <p>CO4: Study the fundamentals of color image processing (K2-understand, A2)</p>				
Unit I	<p>Introduction : 4hrs :CO1</p> <p>Overview of digital image processing, type of digital images and their representations, nature and type of image processing, digital image processing operations, application and relevance of digital image processing</p>				
Unit II	<p>Digital Imaging System: 4hrs:CO1</p> <p>Image acquisition, physical and biological aspects of image acquisition, sampling and quantization, image quality, image storage and file formats</p>				
Unit III	<p>Image processing in spatial domain: 8hrs :CO1</p> <p>Importance of point processing, basic point processing operations, histogram, thresholding, smoothing and sharpening spatial filters</p>				
Unit IV	<p>Image processing in frequency domain: 6hrs: CO2</p> <p>Frequency components in digital images, two-dimensional discrete Fourier transform, concept of image filters, smoothing and sharpening frequency domain filters</p>				
Unit V	<p>Image restoration: 4hrs :CO3</p> <p>Type of noise models, cleaning salt-pepper and Gaussian noise from the digital images, estimating the degradation functions, inverse filtering</p>				
Unit VI	<p>Morphological operations:4hrs:CO3</p> <p>Basic idea behind image morphology, dilation and erosion, opening and closing, the hit-or-miss transform, some basic morphological algorithms</p>				
Unit VII	<p>Image segmentation:4hrs:CO3</p> <p>Detection of discontinuities, edge linking and boundary detection, region based segmentation</p>				
Unit VIII	<p>Image compression:6hrs:CO3</p> <p>Importance of image coding and compression, image compression models, loss-less and lossy compression,</p>				
Unit IX	<p>Color image processing:4hrs:CO4</p> <p>Basics of color image processing, color models, pseudo coloring</p>				
Text Books	<ol style="list-style-type: none"> 1) R. C. Gonzalez and R. E. Woods, Digital Image Processing, Pearson Education , 2006 2) S. Sridhar, Digital Image Processing, Oxford University Press , 2012

Course code: IEE/PE/B/T/42E	Data Analysis for Instrumentation System	L T P C 3 0 0 3
Course Prerequisites	BS/MTH/T111, BS/MTH/T122, FET/BS/B/Math/T/211, IEE/PE/B/T/41B	
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • nature of the measured data. • different feature extraction and selection techniques. • various data preprocessing techniques. • different types of modelling and analysis techniques. 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe the nature of the measured data. (K2, A1).</p> <p>CO2: Describe and discuss the different feature extraction techniques (K2, A3-differentiate).</p> <p>CO3: Describe and apply the various data preprocessing techniques. (K3, A1).</p> <p>CO4: Describe and apply the different types of modeling and analysis techniques. (K3, A1).</p>	
Unit I	<p>Data presentation: CO1:15 hrs</p> <p>Methods of collection of primary data. Review of discrete and continuous variables, frequency distributions, cumulative frequency distribution, tabulation of data, mean of grouped data, median, mode, variance and standard deviation, skewness and kurtosis.</p>	
Unit II	<p>Feature extraction and selection: CO2:10 hrs</p> <p>Types of features, feature extraction and selection techniques.</p>	
Unit III	<p>Data preprocessing: CO3:10 hrs :</p> <p>Need for data preprocessing, Data handling and cleaning techniques, Data reduction techniques.</p>	
Unit IV	<p>Modelling and analysis techniques: CO4: 25 hrs</p> <p>Concept of different data modelling and analysis techniques, different data clustering and classification techniques, Linear and nonlinear regression analysis, performance measure techniques. Data analysis tools: Python, R, MATLAB.</p>	
Text Books	<ol style="list-style-type: none"> 1) Statistical Pattern Recognition by A. Webb, John Wiley & Sons, Ltd., England (2002). 2) Pattern Classification by Richard O. Duda, Peter E. Hart, David G. Stork, John Wiley & Sons, 2012 	
Reference Books	1) Feature Extraction: Foundations and Applications by Isabelle Guyon, Steve Gunn, MasoudNikravesh, Lofti A. Zadeh, Springer, 2008	
Mode of Evaluation	Written CT-I & II and Assignments Final-Written Term End Examination	
Course delivery format	Primarily black board teaching and tutorial assignments	
Supplementary academic support	Providing links to online instrument manufacturer and maintenance sites, providing additional learning materials from research papers	
Other learning activities	Class discussions of recent developments in sensing technology based on research papers, demonstration of various industrial type instruments, Group problem solving sessions, Relate to other courses in the curriculum with examples

Course code: IEE/PE/B/T/42F	Electronic Olfaction & Taste Sensing	L	T	P	C
		3	0	0	3
Course Prerequisites					
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Artificial smell and taste sensing systems • Different types of instruments for smell and taste parameter measurements • Sample handling for both the sensor systems • Sensors for olfaction and taste sensing • Instrumentation scheme for electronic nose and tongue • Sensor response analysis system • Combination of electronic nose and tongue 				
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Explain and interpret artificial sensing system for smell and taste (K2, A1)</p> <p>CO2: Understand the use of analytical instruments for smell and taste parameter measurements (K2, A2-study)</p> <p>CO3: Study different analysis techniques for handling sensor responses (K4,A2)</p> <p>CO4: Classify different types of sensors and instrument for smell and taste identification (K2, K4)</p> <p>CO5: Apply electronic sensing systems for real time applications (K3, A3-adapt)</p>				
Unit I	<p>Introduction : 8hrs : CO1</p> <p>Introduction to human olfaction and taste sensing mechanism, Nasal chemosensory detection, Thresholds for odour and nasal pungency, Psychometric functions for odour and nasal pungency, Olfactometry –Static and dynamic, Environmental chambers. Introduction to Electronic taste sensing system, Basic tastes</p>				
Unit II	<p>Instruments for chemical sensing: 6hrs: CO1,CO2</p> <p>Gas Chromatography, Olfactometry. HPLC- Taste attributes, Electronic nose, Electronic Tongue</p>				
Unit III	<p>Sample handling and delivery system: 8hrs :CO3</p> <p>Physics of evaporation, Sample flow system, Headspace sampling, Diffusion method, Permeation method, electrochemical sensing methods,</p>				
Unit IV	<p>Sensors for olfaction and Taste sensing:10hrs :CO4</p> <p>Survey and classification of chemosensors, Chemoresistors, MOS, Organic Conducting Polymers, Chemocapacitors, QCM, SAW, Optical odour sensors.</p>				
Unit V	<p>Signal conditioning, pre-processing and analysis techniques: 8hrs :CO4</p> <p>Interface circuits, Baseline manipulation, Normalization, Noise in sensors and circuits. Pattern recognition methods: Nature of sensor array data, Classification of analysis techniques. Statistical pattern analysis techniques: Linear Discriminant analysis, Principal component analysis, Cluster analysis. Intelligent Pattern Analysis Methods: Multilayer feedforward networks, Competitive feature mapping networks, Fuzzy based pattern analysis, Neuro fuzzy systems etc</p>				
Unit VI	<p>Introduction to Combined sensing systems: 8hrs: CO5</p> <p>Data level fusion, Feature level fusion, Decision level fusion, Fusion models</p>				
Text Books	<p>1) Process Dynamics & Control by D. E. Seborg, T. F. Edgar & D. A. Mellichamp, 2nd eds., John Wiley & Sons.</p> <p>2) Sensors and Sensory Systems for an Electronic Nose: J.W.Gardner</p>

Course code: IEE/HS/B/Prod/T /425	INDUSTRIAL MANAGEMENT	L T P C 3 0 0 3
Course Prerequisites		
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Industrial management processes • Solution of management problems using operational research techniques • Concepts of maintenance and quality control • Inventory and materials management techniques • Concepts of organizational control 	
Course Outcome:	<p>On completion of the course, the students will be able to</p> <p>CO1: Classify industrial management processes. (K2, A1-describe)</p> <p>CO2: Solve management problems using various techniques of operational research. (K3, A2-model)</p> <p>CO3: Explain various concepts of maintenance and quality control. (K2, A1)</p> <p>CO4: Analyse inventory and materials management techniques. (K4, A2-examine)</p> <p>CO5: Illustrate concepts of organizational control. (K2, A2-show)</p>	
Unit I	<p>Introduction to Industrial Management: 10 L</p> <p>Epistemology of industrial management, its importance and relevance in the context of present industrial scenario. Types of industries and manufacturing systems. Principles and functions of management. Operations economy (break-even analysis). Production forecasting.</p>	
Unit II	<p>Operational Research and Resource Management: 12 L</p> <p>Introduction to operational research, linear programming (graphical and Simplex methods), duality. Transportation and assignment problems. Queuing theory. Game theory. Decision making and its models, fuzzy logic. Project network diagramming, CPM, PERT, time cost trade off, project crashing, line balancing.</p>	
Unit III	<p>Maintenance Management and Quality Control: 10 L</p> <p>Maintenance management, reliability, replacement theory. Introduction to quality control, statistical quality control</p>	
Unit IV	<p>Materials Management: 6L</p> <p>Inventory decision, EOQ, EPQ models, ABC analysis, VED, HML, SDE, FSN, XYZ analyses. MRP, JIT</p>	
Unit V	<p>Organizational Control: 6L</p> <p>Work environment. Theory of motivation. Organization and methods. Work study. Productivity, DEA, CCR model</p>

OPEN ELECTIVE COURSES OFFERED BY DEPT. OF IEE

Course code:	Basic Measurements and Instrumentation	L	T	P	C
		3	0	0	3
Version No.	Not assigned				
Course Prerequisites	Not assigned				
Objectives:	<p>The course aims to provide adequate knowledge about</p> <ul style="list-style-type: none"> • Measurement system, • Measuring, Monitoring and Analytical Instruments • Calibration and Installation procedure • Instrumental Analysis 				
Course Outcomes:	<p>On completion of the course the students will be able to</p> <p>CO1: Solve problems related to statistical analysis, mean, median, mode, Standard Deviation, Gaussian Distribution etc</p> <p>CO2: Define and explain basic concepts of Measurement system and their Static and Dynamic Characteristic(K1, A1)</p> <p>CO3: Describe the electrical and electronic measurement systems (K2,A1)</p> <p>CO4: Describe fundamental knowledge of sensors and instruments, their design, application in research and industrial application (K2,A1)</p> <p>CO5: Discuss the concept, design, Advantages, applications of data acquisition system, (K3-apply,A2)</p>				
Unit I	<p>MEASUREMENTS AND INSTRUMENTATION</p> <p>Functional elements of an instrument – Calibration -Static and dynamic characteristics – Errors in measurement – Statistical evaluation of measurement data – Standards and calibration- Principle and types of analog and digital voltmeters, ammeters</p> <p>Electrical And Electronic Instruments :</p> <p>Principle and types of multi meters –watt meters and energy meters – Magnetic measurements – Instruments for measurement of frequency and phase.</p> <p>Comparative Methods Of Measurements :</p> <p>D.C potentiometers, D.C & A.C bridges, transformer ratio bridges, self-balancing bridges. Interference & screening – Multiple earth and earth loops – Electrostatic and electromagnetic Interference – Grounding techniques.</p>				
Unit II	<p>Storage And Display Devices : Magnetic disk and tape – Recorders, digital plotters and printers, CRO and DSO, LED, LCD & Dot matrix display</p>				
Unit III	<p>Basic Transducer- Capacitive Resistive ,Inductive, Hall-Effect, Optical, Piezoelectric Transducers, and their application in Mass, Force, Torque, Vibration, Translational Motion and Shock Measurement, Smart sensors-Thermal Imagers</p>				
Unit IV	<p>Industrial Measurement:- Process variables Process Variable Measurement Like High And Low Pressure, Compressible Fluid Flow rate , Solid And Liquid Level, Non-Contacting and Contacting Temperature Measurement, Basic Concept Of Process Control, Control Schemes,</p>				
Unit V	<p>Analog and Digital Data acquisition System, SAI F: Introduction to Sophisticated Analytical Instruments , Brief overview of Spectrometer, different type of Microscope, Ph meter, Conductivity Meter</p>				
Text Books	<p>Principles of Industrial Instrumentation : D Patranabis, McGraw-Hill Inc.,US</p> <p>A Course in Electronic Measurements and Instrumentation, A.K. Sawhney, Dhanpat Rai & Co.</p> <p>Measurement and Instrumentation: Theory and Application, Second Edition,Alan S Morris Reza Langari</p> <p>Introduction to Measurements and Instrumentation,Arun kr Ghosh, pH</p>				
Reference Books	<p>Measurement-and-Analysis, IV Edition : Bela G. Liptak, CRC</p>				
Mode of Evaluation	<p>Written CAT-I & II and Assignments</p> <p>Final-Written Term End Examination</p>				
Course delivery format	<p>Class room lecture, Tutorial and Discussion</p>				
Supplementary academic support	<p>Providing links to online courses/sites, providing additional learning materials from practical applications</p>				
Other learning activities	<p>Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples</p>				

Course code:	Electronic Measurements: Principles and Systems	L T P C 3 0 0 3
Course Prerequisites	Circuit theory, Fundamentals of Instrumentation, Electronic Circuits, Digital Circuits	
Objectives:	<ul style="list-style-type: none"> To understand how different types of electronic meters work and their construction and applications. To gain the knowledge for designing an electronic measurement system. 	
Course Outcomes:	<p>On completion of the course, the students will be able to</p> <p>CO1: Describe electrical and electronic voltmeters, ammeters, multimeters and measurement procedures of resistance, capacitance and inductance (K1).</p> <p>CO2: Explain the functions of a potentiometer, wattmeter, energy meter, oscilloscope, (K2, A1)</p> <p>CO3: Explain the functions of frequency meter, Q meter (K2, A1)</p>	
Unit I	Electrical and electronic voltmeters and ammeters: 18hrs PMMC, MI, Electrodynamometer Measurement of Resistance: Wheatstone bridge & Kelvin's Double bridge (DC Bridge), Meggar Measurement of Capacitance: De Sauty's bridge & Schering bridge (AC Bridge) Measurement of Inductance: Maxwell's inductance capacitance bridge (AC Bridge)range extension Analog electronic voltmeter – AC and DC, True RMS voltmeter, Digital Voltmeter,	
Unit II	Potentiometer, Wattmeter, Energy meter: 14hrs Basic concept of Potentiometer, Wattmeter and Energy meter Oscilloscope Time Base, Triggering, Oscilloscope Controls, Oscilloscope Probes, Digital Storage Oscilloscope	
Unit III	Frequency meter, Q-meter: 8hrs Frequency meter, Q Meter	
Text Books	1. Golding E.W. & Widdis F.C. : Electrical Measuring Instruments & Measurements; Wheeler 2. Helfrick A.D. & Cooper W.D. : Modern Electronic Instrumentation & Measuring Instruments; Wheeler 3. Bell, David : Electronic Instrumentation & Measurement, Reston Publishers 4. D.C. Patranabis, Principles of Electronic Instrumentation, PHI	
Reference Books	1. Harris, F. K. – Electrical Measurements, Wiley. 2. Bernard Oliver and John Cage, McGraw Hill	
Mode of Evaluation	Sessional – Written CT-I & II Final-Written Term End Examination	
Course delivery format	Primarily black board teaching and design assignments	
Supplementary academic support	Providing links to online instrument manufacturer and maintenance sites, providing additional learning materials from research papers	
Other learning activities		
Supporting Laboratory course		
Recommended by the Board of Studies on		
Date of Approval by the Academic Council		

Course code:	Industrial Electronics	L T P C 3 0 0 3
Course Prerequisites	ES/BE/T102B, IEE/PC/B/T/214	
Objectives:	<ul style="list-style-type: none"> To introduce and familiarize students with the basic principles and applications of Industrial power electronic devices like SCR, TRIAC, UJT etc. Acquaint students with single phase and three phase rectifier and inverter circuits. Accustom students with the speed control techniques of AC and DC motors. Familiarize students with resistance welding, industrial heating techniques like Induction and Dielectric heating; Industrial and sequential timers. 	
Course Outcome:	<p>On completion of the course, the students should be able to:</p> <p>CO1: Describe the working principles and applications of different Industrial power electronic devices like SCR, TRIAC, UJT etc. (K2, A1). CO2: Explain the working principle of single phase and three phase rectifier and inverter circuits. (K3, A1). CO3: Describe the speed control techniques of AC and DC motors.(K2, A1) CO4: Explain the working principle of resistance welding, industrial heating techniques like Induction and Dielectric heating; Industrial and sequential timers. (K2,A1).</p>	
Unit I (CO1)	<p>Different Industrial power electronic devices like SCR, TRIAC and UJTs: 8 hours.</p> <p>The thyristor family: SCR, TRIAC. SCR turn-on and turn-off methods. Series and parallel operation of SCR's, circuits for gate triggering. ON-OFF control using SCR and snubber circuits.</p> <p>Some more common triggering devices and their applications: UJT, DIAC and PUT.</p>	
Unit II (CO2)	<p>Single phase and polyphase rectifier and inverter circuits. : 12hrs</p> <p>Single phase and three phase Rectifiers: Single phase controlled rectifiers with RC and RL load, behavior of circuit with flywheel diode, three phase controlled rectifiers.</p> <p>Inverters, SMPS and UPS.</p>	
Unit III (CO3)	<p>Speed control techniques of AC and DC motors. : 10 hrs</p> <p>Introduction to AC motor speed control and introduction of DC motor speed control.</p>	
Unit IV (CO4)	<p>Welding, Heating and Timers : 10 hours</p> <p>Introduction to resistance welding and its control, Industrial heating: Induction and Dielectric heating. Industrial timers, sequential timers.</p>	

Text Books	1. Industrial and Power Electronics – G. K. Mithal and Maneesha Gupta, Khanna Publishers, 19th Ed., 2003. 2. Power Electronics, Circuits, Devices and Applications- M.H.Rashid, Pearson, 2007
Reference Books	Power Electronics, P.C.Sen.
Mode of Evaluation	Written CAT-I & II and Assignments Final-Written Term End Examination
Course delivery format	Primarily black board teaching and assignments
Supplementary academic support	Providing links to online courses/sites, providing additional learning materials from practical applications.
Other learning activities	Class discussions, Group problem solving sessions, Relate to other courses in the curriculum with examples
